

# Formal (4+1) Cycloaddition of Methylenecyclopropanes with 7-Aryl-1,3,5-cycloheptatrienes by Triple Gold(I) Catalysis\*\*

Yahui Wang, Michael E. Muratore, Zhouting Rong, and Antonio M. Echavarren\*

**Abstract:** 7-Aryl-1,3,5-cycloheptatrienes react intermolecularly with methylenecyclopropanes in a triple gold(I)-catalyzed reaction to form cyclopentenes. The same formal (4+1) cycloaddition occurs with cyclobutenes. Other precursors of gold(I) carbenes can also be used as the C<sub>i</sub> component of the cycloaddition.

Carbenes have been widely used as one-carbon synthon in organic synthesis, particularly in the context of cyclopropanation reactions.<sup>[1]</sup> However, only a few (4+1) cycloadditions<sup>[2]</sup> have been reported mainly with Fischer alkoxy-(alkenyl)carbene complexes<sup>[3]</sup> and dialkoxy carbene<sup>[2,4]</sup>. To the best of our knowledge, there is no report on the (4+1) cycloaddition of aryl carbenes with 1,3-dienes, probably because of the known propensity of carbenes to give cyclopropanation products with 1,3-dienes.<sup>[5]</sup> We postulated that due to their high strain and unique electronic properties, cyclobutenes<sup>[6]</sup> could be used as synthetic equivalents of 1,3-dienes for the development of a formal (4+1) cycloaddition with metal carbenes.

We have recently found that 7-substituted 1,3,5-cycloheptatrienes **1** undergo gold(I)-catalyzed retro-Buchner reaction to form carbenes **2** (Scheme 1).<sup>[7]</sup> Herein, we report a novel and potentially general formal (4+1) cycloaddition by reaction of **1** with methylenecyclopropanes **3**<sup>[8]</sup> or cyclobutenes **4** to form cyclopentenes **5**. In this transformation, methylenecyclopropanes **3** undergo an isomerization to form cyclobutenes **4** similar to that catalyzed by platinum or palladium.<sup>[9]</sup> Therefore, in the reaction between **1** and **3**,

Scheme 1. New strategy for the formal (4+1) cycloaddition.

gold(I) plays a triple catalytic role, isomerizing **3** into **4** and, in parallel, generating gold(I) carbenes **2** from **1**, which cyclopropanate the cyclobutenes. Finally, gold(I) cleaves the internal C–C bond of the resulting bicyclo[2.1.0]pentanes to form the cyclopentenes. This reaction can be viewed as an insertion of one carbon into a double bond, a process that has only been achieved in rare cases with dihalocarbenes.<sup>[10,11]</sup>

Methylenecyclopropanes (MCPs) **3** can be readily prepared in one step by the Wittig olefination of carbonyl compounds with commercially available 3-bromo-triphenylphosphonium bromide. We first examined the reaction of phenylmethylenecyclopropane (**3a**) with 7-naphthyl-cyclohepta-1,3,5-triene (**1a**) in the presence of gold(I) complexes (Table 1). Using cationic [(JohnPhos)Au(MeCN)]SbF<sub>6</sub> (**A**) in 1,2-dichloroethane at 120°C, disubstituted cyclopentene **5a** was isolated in 76% yield (Table 1, entry 1). Other phosphine or N-heterocyclic carbene gold(I) complexes **B–E** gave lower yields (entries 2–5), whereas complexes **F** and **G** failed to promote this transformation, presumably due to their instability at the temperature required for the retro-Buchner reaction. The reaction also failed with silver(I), copper(II), and platinum(II) catalysts (entries 8–10).

7-Aryl-cyclohepta-1,3,5-trienes containing groups with different electronic and steric effects at the *ortho*, *meta*, or *para* positions reacted with MCPs **3a–h** to yield the (4+1) cycloadducts **5b–m** (Table 2). The (4+1) cycloaddition proceeds satisfactorily with MCP bearing arenes with fluoro-, chloro-, and bromo-substituents. However, the reaction with *o*-bromophenylmethylenecyclopropane (**3f**) led to cycloadduct **5k** in lower yield. The structure of **5k** was confirmed by X-ray diffraction (Figure 1).<sup>[12]</sup> To demonstrate the synthetic utility of this method, cyclopentene **5l** was prepared on a 500 mg scale using only 1 mol % gold catalyst **A** in 51% yield after purification by column chromatography. Alkylmethylenecyclopropanes also reacted to give (4+1) cycloaddition products, although in this case the reactions led to mixtures of regioisomers **5n'–p'**.

Substrate **3l** reacted intramolecularly using catalyst **E** to form 2,3-dihydro-1*H*-cyclopenta[*l*]phenanthrene (**5q'**) by iso-

**Table 1:** Gold(I)-catalyzed reaction of 7-(1-naphthyl)-1,3,5-cyclohepta-  
triene (**1a**) with phenylmethylenecyclopropane (**3a**).<sup>[a]</sup>

Entry	Catalyst	Yield [%] <sup>[b]</sup>
1	A	81 (76) <sup>[c]</sup>
2	B	25
3	C	28
4	D	<5
5	E	47
6	F	— <sup>[d]</sup>
7	G	— <sup>[d]</sup>
8	H	— <sup>[d]</sup>
9	I	— <sup>[d]</sup>
10	J	— <sup>[d]</sup>

[a] Reaction at 120°C (0.2 M in 1,2-dichloroethane), 2 equiv of **3a**, catalyst (5 mol%), 2 h. [b] Yields determined by <sup>1</sup>H NMR spectroscopy using 1,4-diacetylbenzene as internal standard. [c] Yield of isolated product. [d] Not detected.

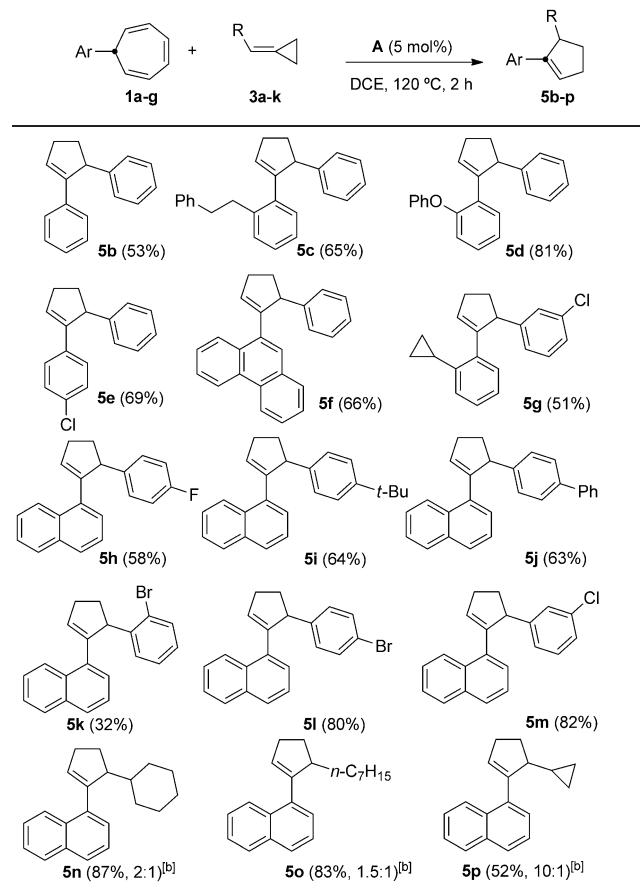

merization of the initially formed adduct **5q** (Scheme 2). In addition, polyarene fragments can be obtained by photochemical cyclization. Thus, compound **5f** can be transformed into a cyclopenta derivative of benzo[g]chrysene (**6**) by a one pot photo-induced isomerization/oxidative Mallory cyclization.<sup>[13]</sup>

Tetrasubstituted MCP **3m** reacted with **1a** to give only the product of cyclopropanation **7** (Scheme 3 and Figure 1), whose structure was confirmed by X-ray diffraction (Figure 1).<sup>[12]</sup> Given that **3m** does not undergo ring-expansion, the isolation of spiro derivative **7** strongly suggests that the cyclopropanation of MCP is not the initial step in the formal (4+1) cycloaddition and that cyclobutenes are likely intermediates in this transformation.

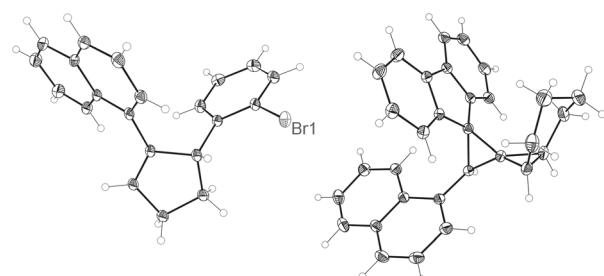

To confirm the hypothesis that cyclobutenes are intermediates in the (4+1) reaction of MCP, we performed the reaction of **1a** with cyclobutene **4a**, which was isolated from the reaction mixture of **1a** and **3g**. Under identical conditions, cycloadduct **5l** was isolated in 77% yield. Trisubstituted cyclobutenes<sup>[14]</sup> also took part in the (4+1) cycloaddition reaction to afford cyclopentenes **5r-z** (Table 3).

Cyclobutenes also react with intermediate gold(I) carbenes generated by 1,2-acyloxy migration of propargylic acetates<sup>[15]</sup> under mild conditions with catalyst **E** to give two separable isomers **5aa-ac** and **5'aa-ac** in good overall yields (Scheme 4). By performing the reaction at room temperature

**Table 2:** Scope of the formal (4+1) cycloaddition between cyclohepta-  
triene **1** and methylenecyclopropanes **3**.<sup>[a]</sup>

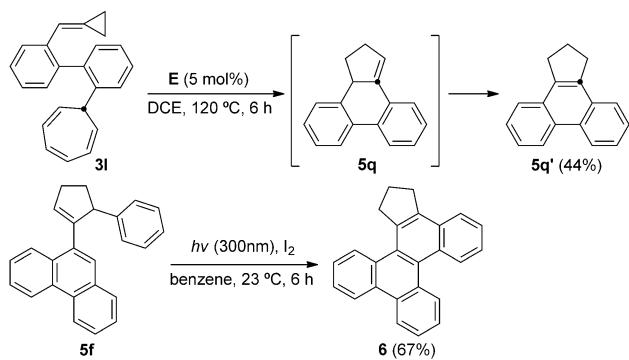

[a] Reaction at 120°C, 0.2 M in 1,2-dichloroethane, 2 equiv of **3a-k**, catalyst **A** (5 mol%), 2 h. Yields are for isolated products. [b] Reaction time = 3 h. 3-Alkyl-3-aryl-1-alkenes **5'n-p** were also obtained as minor regioisomers.

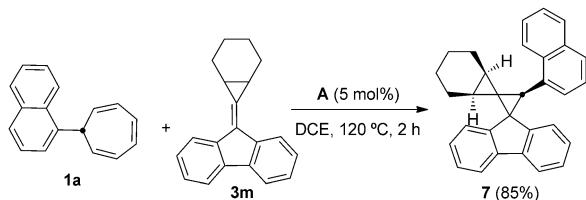

**Figure 1.** X-ray crystal structures of **5k** and **7**.

at only 60% conversion, bicyclo[2.1.0]pentane **10a**<sup>[16]</sup> could be isolated and then transformed cleanly into **5aa** at 40°C in the presence of gold(I) catalyst. The gold(I) carbene generated from phenyl diazomethane<sup>[17-20]</sup> reacted similarly at room temperature with cyclobutene **4c** to form the desired formal (4+1) product **5ad**, along with **10b**.<sup>[21]</sup> This bicyclo[2.1.0]pentane was converted quantitatively into cyclopentene **5ad** by warming at 60°C in the presence of gold complex **A**.

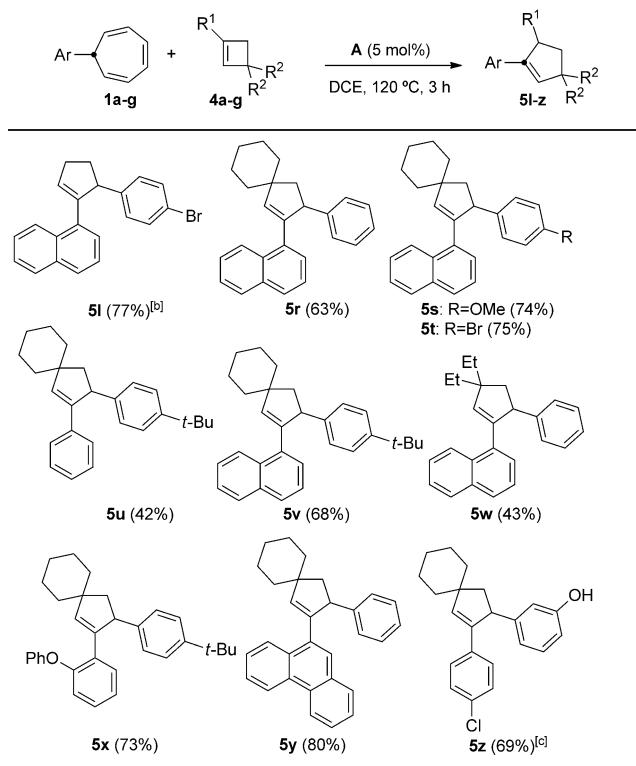

**Scheme 2.** Intramolecular formal (4+1) cycloaddition and its application to the preparation of a polyarene fragment.

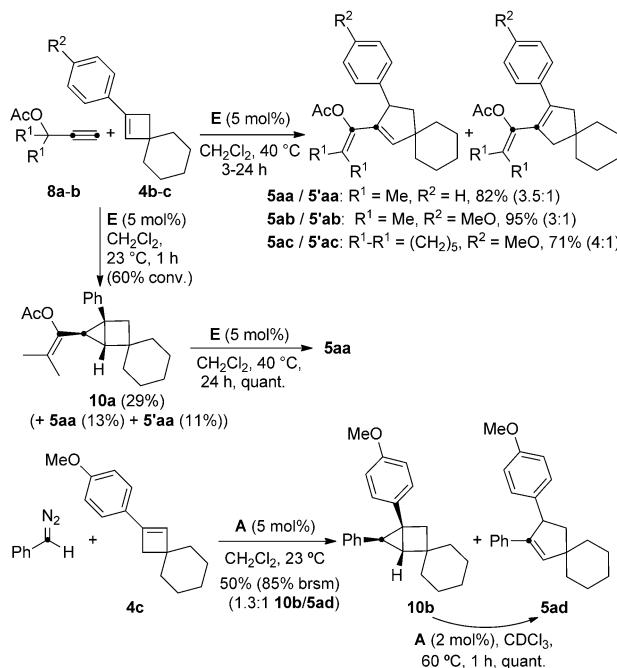

**Scheme 3.** Probing the mechanism of the formal (4+1) cycloaddition.

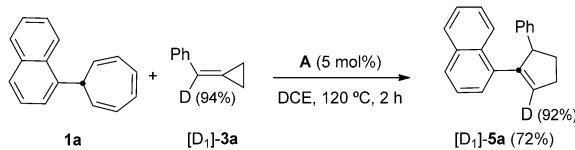

**Table 3:** Scope of the formal (4+1) cycloaddition between cyclohepta-1,3,5-trienes **1** and cyclobutenes **4**.<sup>[a]</sup>

[a] Reaction at 120 °C, 0.2 M in 1,2-dichloroethane, 2 equiv of **4a-g**, catalyst **A** (5 mol%), 3 h. Yields are for isolated adducts. [b] Cyclobutene **4a** was isolated from the reaction mixture of **1a** and **3g**. [c] 2 Equiv of 7-(4-chlorophenyl)cyclohepta-1,3,5-triene were used.

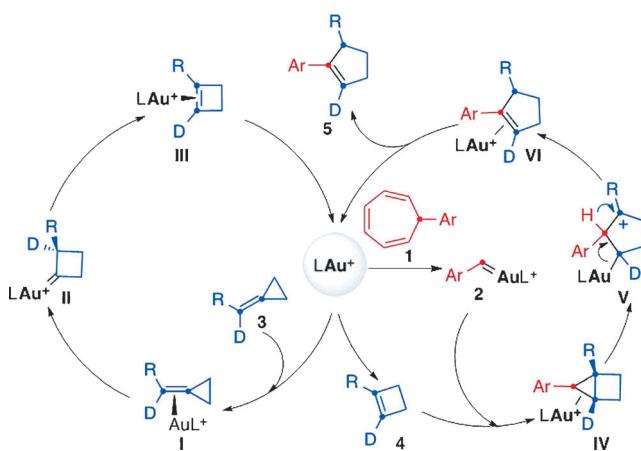

**Scheme 4.** Formal (4+1) cycloaddition with various gold(I) carbenes.

**Scheme 5.** Deuterium labeling experiment to probe the mechanism.

To shed additional light on the reaction mechanism, we performed the reaction of cyclohepta-1,3,5-triene **1a** with MCP **[D<sub>1</sub>]-3a** in the presence of catalyst **A** (Scheme 5). In this experiment, **[D<sub>1</sub>]-5a** was obtained with the deuterium label transferred completely to C-3.

According to all experimental data, we propose a mechanism for this formal (4+1) cycloaddition of cyclohepta-1,3,5-triene **1** and MCP in which gold(I) plays a triple role (Scheme 6). In the first catalytic cycle,  $\eta^2$ -MCP-gold(I) complex **I** undergoes ring expansion to form intermediate **II**, which gives  $\eta^2$ -cyclobutene-gold(I) complex **III**. Associative ligand exchange with the 7-aryl-1,3,5-cyclohepta-1,3,5-triene, followed by retro-Buchner reaction then leads to the highly reactive gold(I) carbene **2**,<sup>[7]</sup> which reacts with cyclobutene **4** to form bicyclo[2.1.0]pentane-gold(I) complex **IV**. Cyclopropane opening by gold(I) forms the tertiary carbocation **V**, which leads to complex **VI** by a final 1,2-H shift. The cyclopropanation of **4** by **2**, followed by electrophilic cleavage probably follows a pathway similar to that occurring in the gas phase for the cyclopropanation/retro-cyclopropanation of enol ethers with gold(I) carbenes.<sup>[22]</sup> Formation of cyclopentenes from bicyclo[2.1.0]pentanes, the presumed intermediates of these reactions, has been mechanistically examined in a few cases using Rh<sup>I</sup>, Zn<sup>II</sup>, and other catalysts.<sup>[23,24]</sup> Formation of regiosomeric 3-alkyl-3-arylcyclopent-1-enes

**Scheme 6.** Proposed mechanism for the formal (4+1) cycloaddition.

together with **5n-p** in the reaction of alkyl-substituted MCP can be explained by the competitive migration of the aryl group in intermediates **V**.

In summary, we have developed a synthesis of substituted cyclopentenes by a formal (4+1) cycloaddition from methylenecyclopropanes or cyclobutenes with gold(I) carbenes generated under catalytic conditions by retro-Buchner reaction of 1,3,5-cycloheptatrienes or by other methods. Further work on the application of this cycloaddition in synthesis is underway.
